

The OptiSense Easter surprise

It was just before Easter and the Easter Bunny had his paws full. He had to paint and hide lots of eggs so that the children could look forward to a colourful search on Easter Sunday.

But this year he had a little problem: his paints just wouldn't stay on the Easter eggs. Every time he painted the eggs and let them dry, the paint would flake off again. Master Bunny was at a loss and wondered what he could do.

Then he remembered that a fellow bunny had a testing system from OptiSense to measure the thickness of the paint on his eggs. The "Paint-Checker" could help him determine the optimal thickness of the paint layer on the eggs so that the paint did not flake off.

So the Easter Bunny did not hesitate for long and tested the applied, still fresh paint with the mobile measuring system. The measurement showed that he had to apply the paint a little thicker.

No sooner said than done - Master Bunny painted the eggs again, but this time with the optimum thickness. And lo and behold: the paint held perfectly! The Easter Bunny was overjoyed and since this year he has been relying on the PaintChecker to check the coating thickness when making his Easter eggs.

He now knows that he can rely on his measurement results and continue to present the children with beautiful and colourful Easter eggs.

**The OptiSense Team
wishes you a Happy Easter!**
